Data Export

Richard Veerman / Pascal Groenen (Factory
CRO) **27-SEP-2019**

Data Exports in DFdiscover

- List view
 - Plate and Module based
 - XLS, delimited
- SQLload
- API
- DFsas
 - formatted delimited with an accompanying SAS import file
 - easy to automate

DFsas example

- Run unix program 'create_ascii' in Reports View
 - Calls on DFsas
 - Triggers one macro program per dataset in which fields are assigned to each dataset: s_ files (e.g. s_ae)
 - The s_ file dumps the data of the data fields assigned into one or more pipe delimited raw data text file per dataset
 - Allows normalization of datasets
- Run SAS macro 'start.sas'
 - Runs one SAS program per dataset that pulls in the raw data text file; applies formats; slightly restructures to CDISC; saves as SAS file

GROUP DISCUSSION

- How does the group work?
 - Via List view
 - Basic dumps
 - Enhanced dumps
 - SQL dumps
 - API
- Anyone using the DFsas provided export programs?
- Any other alternatives?

Thank You

Richard Veerman, Factory CRO
